

# VS513Z Hot Sheet

## Balboa Instruments System PN 55839

System Model # VSP-VS513Z-YCAH

Software Version # 39

EPN # 2531

Base PCBA - PN 55840

PCB VS500Z - PN 22972 Rev C or D

Base Panels

VL400 – PN 55129

# System Revision History

<b>System PN</b>	<b>EPN</b>	<b>Date</b>	<b>Requested By</b>	<b>Changes Made</b>
55839	2532	08.01.2007	Balboa	Production release
55839	2566	08.24.2007	Balboa	Update to v41 software, Blower and P2 now 120V
55839	2531	09.20.2007	Balboa	Software set back to v39
55839	2531	10.17.2007	Balboa	Correction to SSID page 6
55839	2531	10.29.2007	Balboa	System now 48A -YCAH

# Basic System Features and Functions

## Power Requirements

- 240VAC, 60Hz, 48A, Class A GFCI-protected service (Circuit Breaker rating = 60A max.)
- 3 or 4 wires [hot, hot, neutral (optional), ground]

## System Outputs

### Setup 1 (As Manufactured)

- 240V Pump 1, 2-Speed
- 120V Pump 2, 1-Speed
- 120V Blower
- 120V Ozone \*
- 12V Spa Light
- 120V AV (Stereo)
- 240V 5.5kW Heater \*\*

### Optional Devices

- 120V Circ Pump \*

\* Ozone and Circ Pump must be same voltage.

\*\* Heater wattage is rated at 240V. When running 120V to heater, output is approximately 25%.

## Additional Options

- Full Feature Dolphin Remote and Spa-only Dolphin Remote
- IR Receiver Module  
Connects to terminal J1 or J2
- MoodEFX Lighting  
Connects to Spa Light terminal J20
- FiberEFX Lighting  
Connects to Spa Light terminal J20

# Basic System Features and Functions

Any time you change a DIP Switch, other than A1, you must reset Persistent Memory for your new DIP Switch Settings changes to take effect. If you do not reset Persistent Memory, your system may function improperly.

## To reset Persistent Memory:

- Power down by disconnecting power source from spa.
- Put a jumper across J43, covering both pins. (See illustration below)
- Power up by connecting power source to spa.
- Wait until “P” is displayed on your panel.
- Power down again.
- Remove jumper from J43 (May also move to cover 1 pin only)
- Power up again.

## About Persistent Memory and Time of Day Retention:

This system uses memory that doesn't require a battery to store a variety of settings. What we refer to as Persistent Memory stores the filter settings, the set temperature, and the heat mode.

Persistent Memory is not used for Time of Day. Only models with a Serial Deluxe panel installed (VS5xxDZ and GS5xxDZ) can display the time. However, during power loss to the spa, the system will lose the correct time, and reset to 12:00 PM when power is restored.

## Power Up Display Sequence

Upon power up, you should see the following on the display:

- Three numbers in a row, which are the SSID (the System Software ID). The third display of these numbers is the Software Version, which should match the version of your system. For example, if these three numbers are 100 67 38, that is a VS511SZ at version 38.
- Displayed next is: “24” (indicating the system is configured for a heater between 3 and 6 kW) or “12” (indicating the system is configured for a heater effectively\* between 1 and 3 kW). “24” should appear for all VS models running at 240VAC. “12” should appear for all VS models running at 120VAC, as well as all GS models. (\*A heater which is rated at 4 kW at 240VAC will function as a 1 kW heater at 120VAC.)
- “P” will appear to signal the start of Priming Mode.

At this point, the power up sequence is complete. Refer to the Reference Card for the VS or GS System model of your spa for information about how the spa operates from this point on, including how to adjust the Time of Day if using a Serial Deluxe style panel.

J43 on VS5xxZ and VS300 Series Main Board Shown.

# DIP Switches and Jumpers Definitions

## SSID 100 69 39

## Base Model VS513Z

### DIP Switch Key

- A1 Test Mode (normally OFF)
- A2 "ON" position: Standard mode only  
"OFF" position: Std/Ecn/Sleep mode changes allowed
- A3 "ON" position: use Mini Panel   
"OFF" position: use Digital Duplex or Light Duplex panel  
- A4 Aux Freeze (must be OFF)
- A5 Disabled when A9 is OFF  
"ON" position: Two-speed pump 1  
"OFF" position: One-speed pump 1 (A9 must be On and a Circ Pump installed)
- A6 "ON" position: 50Hz operation  
"OFF" position: 60Hz operation
- A7+A10 Control amp draw requirements (See Table 1)
- A8 "ON" position: temperature is displayed in degrees Celsius  
"OFF" position: temperature is displayed in degrees Fahrenheit
- A9 "ON" position: 24 Hour Circ Pump with 3°F shut off, Ozone runs with Circ Pump  
"OFF" position: no Circ Pump, Ozone runs with Pump 1-low during filter cycles only

Note: Panel layout is always Pump 2+J17/26, Pump 1, Temp, Light

**Table 1**

**# of Hi-Speed  
Pumps/Blower  
Before Heat Disabled**

A7	A10	
OFF	OFF	0
ON	OFF	1
OFF	ON	2
ON	ON	3

### Jumper Key

- J12** **Factory set. DO NOT MOVE.**  
Jumper must be on Pins 1 and 2 for VS51xZ/VS5xxSZ/VS5xxDZ software.  
Jumper must be on Pins 2 and 3 for VS50xZ software.
- J43** When jumper is placed on 2 pins during power-up, system will reset persistent memory.  
Leave on 1 pin only to enable persistent memory feature.

### WARNING:

- Setting DIP switches incorrectly may cause abnormal system behavior and/or damage to system components.
- Refer to Switchbank illustration on Wiring Configuration page for correct settings for this system.
- Contact Balboa if you require additional configuration pages added to this hot sheet.

### Panel Button Assignments

- 1=Pump 2+J17/26      3=Temp
- 2=Pump 1              4=Light

# Ozone Connections

**Ozone Connector Voltage:** The VS500Z circuit board is factory configured to deliver a preset voltage (120V or 240V) to the on-board ozone connector (J29). See the ratings table on the wiring diagram attached to the cover of the enclosure for the configured voltage. For 240V output W2 connects to Red AC and for 120V output W2 connects to White AC.

The voltage to the ozone connector can be changed in the field if required. W2 just needs to be set for the required voltage.

**WARNING: Changing the voltage of the ozone connector also effects the voltage supplied to the circ pump connector (J47). Any equipment controlled by that connector may be damaged if the wrong voltage is selected.**

**Balboa Ozone Generator:** If the board is set up to operate a 120V ozone generator, the connector on the ozone generator is likely to be configured correctly, but should be compared to the illustration below.

If a 240V ozone generator is required, be sure the red wire in the ozone cord is positioned in the connector next to the green ground wire as described below.

*Note: A special tool is required to remove the pins from the connector body once they are snapped in place. Check with your Balboa Account Manager for information on purchasing a pin-removal tool.*
